I want to plant vegetables, but the soil is very dry and sandy.
The plants look sad and sick, they do not grow well. It is not easy for the plants to grow on this site.
But there are a few simple hints to improve the soil and help my plants grow!

You need healthy soil for healthy plants!

Trees offer your plants shade!

Collect rain water for watering!

Protect your garden from animals with hedges and fences!

Make compost!

Collect green stuff and weeds from your garden, as well as kitchen waste on a compost. Tiny animals will eat this organic waste and produce new soil. You can use the new, dark soil as a very good fertiliser for your garden!

Plant peanuts, sweet potatoes, maize and pepper. They like sand and sun!

Protect soil with mulch!

How can I make compost?

What is mulching?

Cover the soil around your plants with a layer of grass and leaves. This protects soil from drying out in the sun and keeps it moist.
